

GitHub Actions

Crash Course!

Dr. Firas Moosvi

July 13, 2024

Outline

- Continuous Integration, Delivery, Deployment
- Introduction to GitHub Actions
 - Motivation
 - Syntax
 - Practical Example
- Deploy a Django site on render.com
 - Repository Secrets
 - Troubleshooting GitHub Actions
- Q&A

Introduction to GitHub Actions

Clone URL (to follow along): https://classroom.github.com/a/c_ZEKiyH

The components of GitHub Actions [↗](#)

You can configure a GitHub Actions *workflow* to be triggered when an *event* occurs in your repository, such as a pull request being opened or an issue being created. Your workflow contains one or more *jobs* which can run in sequential order or in parallel. Each job will run inside its own virtual machine *runner*, or inside a container, and has one or more *steps* that either run a script that you define or run an *action*, which is a reusable extension that can simplify your workflow.

Understanding the workflow file [↗](#)

To help you understand how YAML syntax is used to create a workflow file, this section explains each line of the introduction's example:

YAML

Beside

Inline

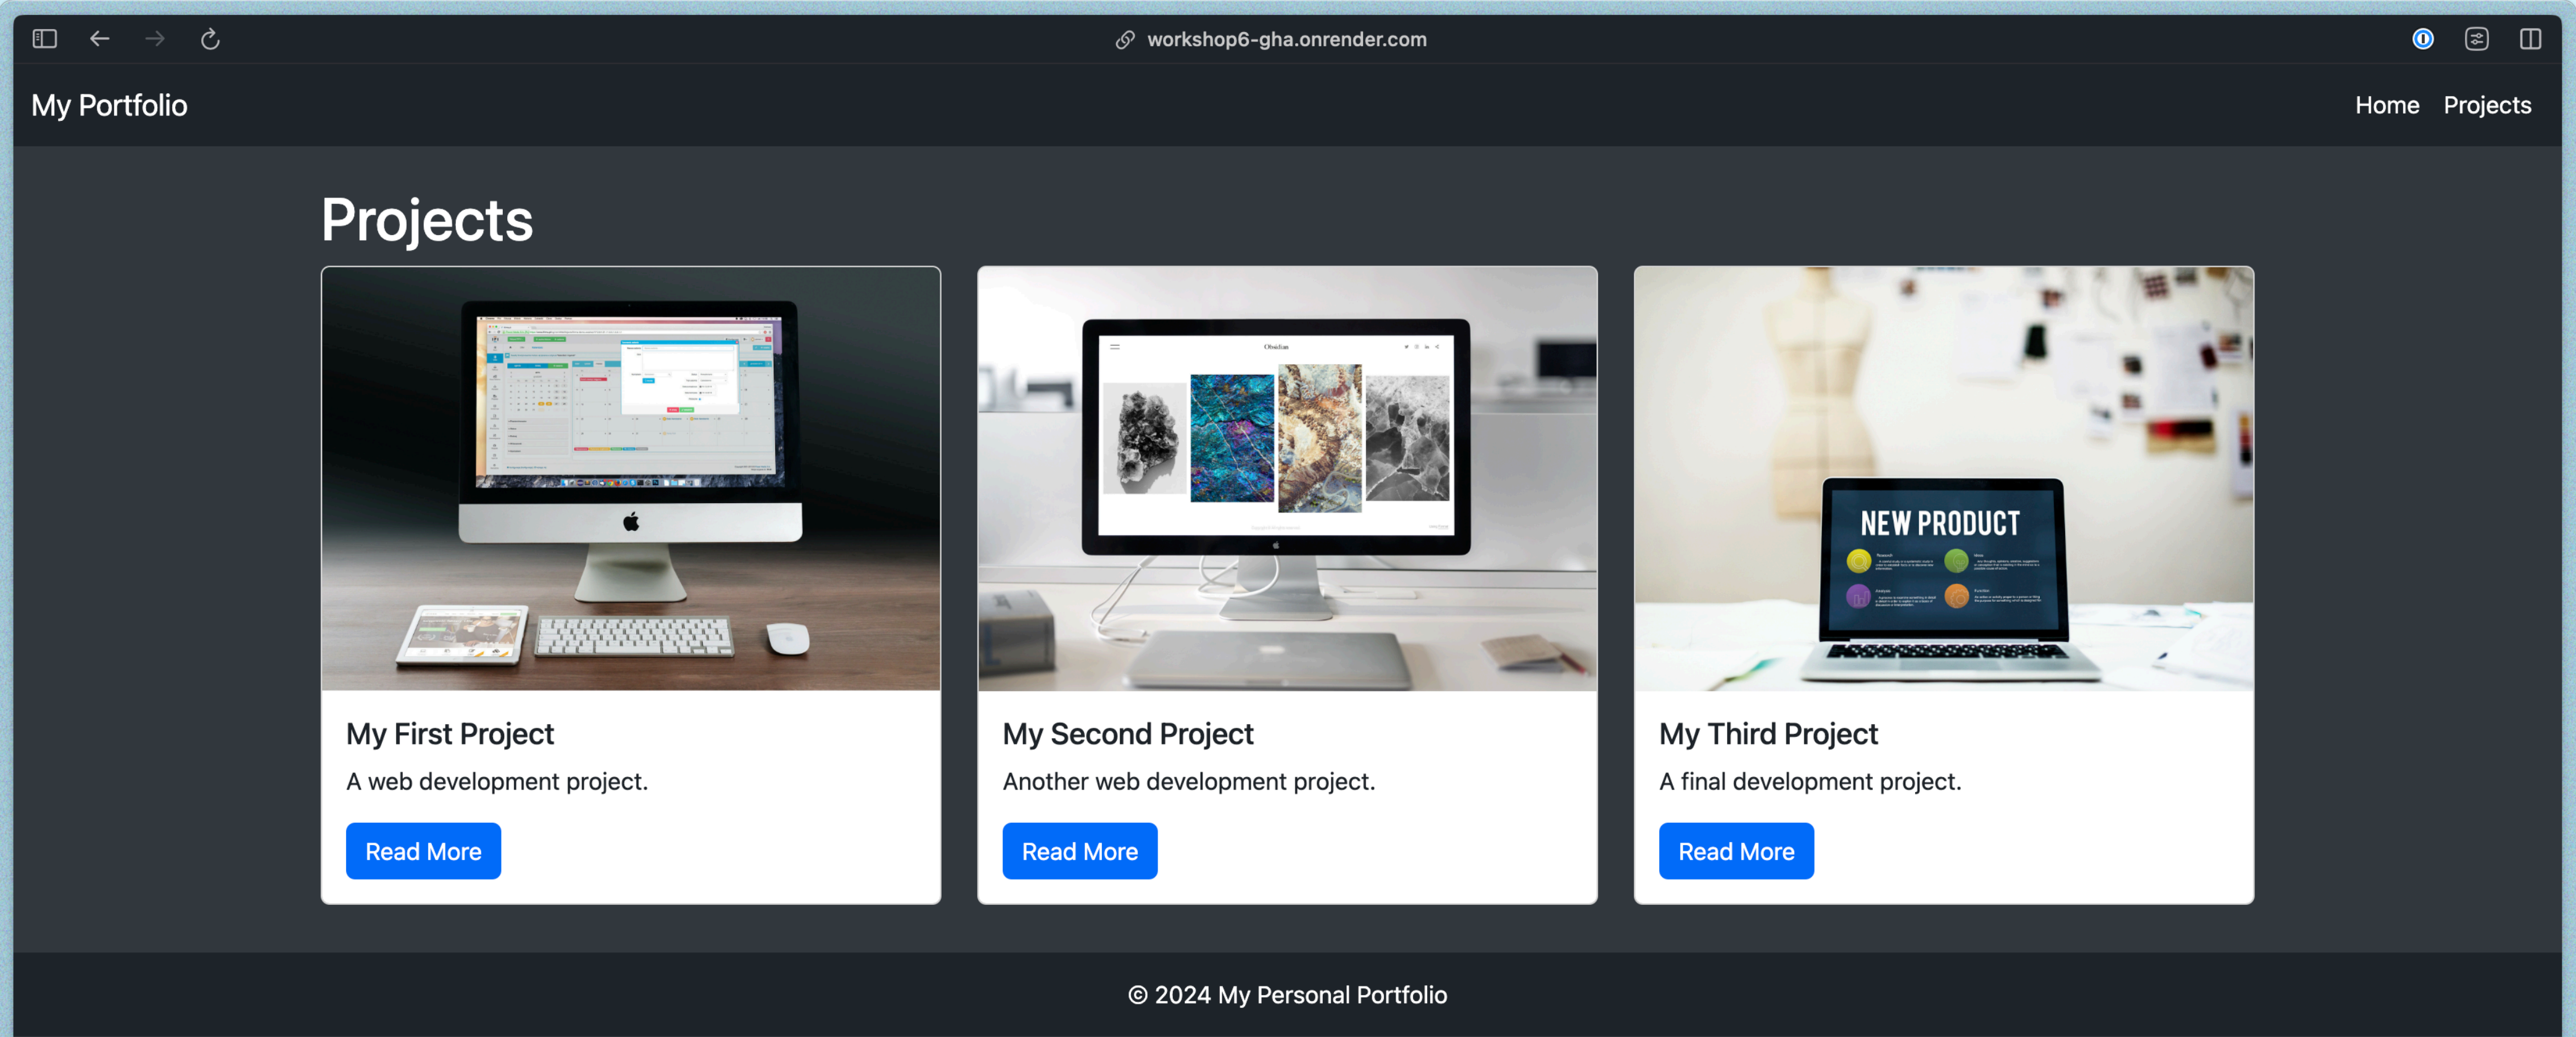

```
name: learn-github-actions
```

Optional - The name of the workflow as it will appear in the "Actions" tab of the GitHub repository. If this field is omitted, the name of the workflow file will be used instead.

```
run-name: ${{ github.actor }} is learning GitHub Actions
```

Optional - The name for workflow runs generated from the workflow, which will appear in the list of workflow runs on your repository's "Actions" tab. This example uses an expression with the `github` context to display the username of the actor that triggered the workflow run. For more information, see "[Workflow syntax for GitHub Actions](#)."

Deploy a Django Site!

Troubleshooting GitHub Actions

tmate to troubleshoot firasm committed 2 months ago · ✖ 0 / 1	Verified 7a4f5e1  
update workflow to adjust firasm committed 2 months ago · ✖ 0 / 1	7333275

Actions

Actions secrets and variables

Secrets and variables allow you to manage reusable configuration data. Secrets are **encrypted** and are used for sensitive data. [Learn more about encrypted secrets](#). Variables are shown as plain text and are used for **non-sensitive** data. [Learn more about variables](#).

Anyone with collaborator access to this repository can use these secrets and variables for actions. They are not passed to workflows that are triggered by a pull request from a fork.

Secrets

Variables

Environment secrets

This environment has no secrets.
